

New super amazing Document

I am just text under the first paragraph. And really this is quite sad because it has no sense.

What it should however provide is paragraph separation.

And checking how it looks if certain text is **bold** or *italic*.

Second layer

Now it should be obvious that if there is a first level heading the chances of second level heading rise exponentially. Other than this I will not spend much time on typing mindless text here.

Second second layer

The following table shows exactly nothing at all other then provide a convenient testbed for different tables formats.

Table 1: A table containing mostly crap. Values of Amount Columns are in EUR.

I am a super merged cell that serves as table heading				
Nothing of	Year	Amount	Nothing useful	
relevance	2023	2010344,5		
goes on in	2022	2012412,6	Just	Some
here	2021	12031212,3		Cells

Third second layer

Incidentally this stuff can also contain bullet lists. Let's see how they are done in xml.

- I am a list
 - I even contain sublists
 - With more than one element
- But nothing really useful here
- Apart from testing
 - Even
 - * Deeper
 - Nesting

Also this paragraph is only meant to demonstrate this stuff is in reading order and lists are embedded in the text.

Numbered items

1. There can also be numbered lists
 1. With nesting
 1. Even rather deep nesting
 2. Especially given there is no content

We can also do images!
